

FA EDU – Independent Study Knowledge Review

Please complete and return this independent study Knowledge Review (preferably by email) to your Trainer *before* attending the face-to-face portion of your training program.

Notes: Question numbers continue from previous unit of competency: HLTAID003 Provide first aid.

Unless otherwise indicated, select *only one* response that best answers the question.

Student Name: Date:

38. If an unresponsive child is taking infrequent and sporadic, slow and noisy gasps, he is breathing normally and there is no need for CPR.

True

False

39. Children may experience cardiac arrest due to respiratory failure, existing heart condition or severe trauma.

True

False

40. Relative to adults, the differences you need to consider to help you determine how to best handle emergencies involving a child include:

Age and size

Ability to understand what is going on or to communicate effectively

Mental state and willingness to cooperate

All of the above

41. With children and infants, a healthy heart will normally beat between 70 and 160 beats per minute and the incidence of cardiac arrest in children is low compared to adults.

True

False

42. Which of the following statements are true in regards to defibrillation with an AED.

Adult AEDs are suitable for use on children older than 8 years.

For children between 1 and 8 years old, special child-sized pads may be available.

Never use child pads on an adult.

All of the above

43. There are case reports demonstrating successful use of AEDs on infants. However, AED use on infants is not supported by definitive research. For this reason, AED use by lay Emergency Responders on infants is not recommended.

True

False

STUDENT STATEMENT: My Trainer explained to me and I now understand any questions I had missed.
